ACLs Study Guide 2011

See www.heart.org/eccstudent. The code is found in the ACLS Provider Manual page ii.

The ACLS Provider exam is 50-multipie choice questions. Passing score is 84%. Student may miss 8 questions. For students taking ACLS for the first time or renewing students with a current card, exam remediation is permitted should student miss more than 8 questions on the exam. Viewing the ACLS book ahead of time with the online resources is very helpful. The American Heart Association link is www.heart.org/eccstudent and has an ACLS Precourse Self-Assessment, supplementary written materials and videos. The code for the online resources is on the ACLS Provider Manual page ii. Basic Dysrhythmias knowledge is required in relation to asystole, ventricular fibrillation, tachycardias in general and bradycardias in general. Student does not need to know the ins and outs of each and every one. For Tachycardias student need to differentiate wide complex (ventricular tachycardia) and narrow complex (supraventricular tachycardia or SVT).

BLS Overview – CAB

Unresponsive patient, no breathing, or no normal breathing
Activate Emergency response and get AED
Start CPR, shock if indicated

Push Hard and Fast-Repeat every 2 minutes

Anytime there is no pulse or unsure about a pulse – do COMPRESSIONS

Elements of good CPR
• Rate- at least 100
• Recoil
• Compression depth at least 2 inches
• Minimize interruptions (less than 10 seconds)
• Avoid excessive ventilation
• Switch compressors every 2 min or 5 cycles

If AED doesn’t promptly analyze rhythm: compressions.

Tachycardia with a Pulse
• If unstable (wide or narrow) - go straight to synchronized cardioversion
• If stable narrow complex
  – obtain 12 lead
  – vagal maneuvers
  – adenosine 6mg RAPID IVP, followed by 12mg

Stroke
Cincinnati Pre-Hospital Stroke Scale
Facial Droop, Arm Drift, Abnormal Speech

rtPA can be given within 3 hours from symptom onset. Important to transport patient to an appropriate hospital with CT capabilities. If CT not available divert to the closest hospital (i.e. 15 min away) with CT

Acute Coronary Syndromes
Vital signs, O2, IV,
12 Lead for CP, epigastric pain, or rhythm change

Defibrillation

Included in Primary Survey

Hands free pads allow for a more rapid defibrillation

Be sure oxygen is not blowing over chest during defibrillation

Shock as soon as defibrillator is available

May continue compressions while defibrillator is charging
Waveform Capnography in ACLS (PETCO2)

- Allows for accurate monitoring of CPR
- Most reliable indicator for ET tube placement

Cardiac Arrest

Shockable Rhythms:
- Ventricular Fibrillation (VF)
- Ventricular Tachycardia (VT) without pulse

Biphasic: 120-200J Monophasic: 360J

Non-Shockable Rhythms:
- PEA
- Asystole
- 2 minute cycles of compressions, shocks (if VF/VT), and rhythm checks.
- Epi 1 mg every 3-5 minutes (preferred method IV)
- NO MORE ATROPINE for Asystole and PEA
- Ventilations – 30:2 Ratio
- Rescue breathing – 1 breath every 5-6 sec
- If advanced airway – 8-10 ventilations/minute

Treat reversible causes (Hs and Ts)

Hypoxia or ventilation problems
- Hypovolemia
- Hypothermia
- Hypo-/hyper-kalemia
- Hydrogen ion (acidosis)

Tamponade, cardiac
- Tension pneumothorax
- Toxins – poisons, drugs
- Thrombosis – coronary (AMI) – pulmonary (PE)

Bradycardia

Need to assess stable versus unstable.
If stable, monitor, observe, and consult.

If unstable . . .
- Atropine 0.5mg IV. Can repeat Q3-5 minutes.
  Maximum dose=3mg (Including heart blocks)
- If Atropine ineffective
  – Transcutaneous pacing
  – Dopamine infusion (2-10mcg/kg/min)
  – Epinephrine infusion (2-10mcg/min)

Return of Spontaneous Circulation (ROSC)

Post Resuscitation Care

First Priority
Optimize Ventilation and Oxygenation
- Maintain O2 sat>94%
- Consider adv. airway and waveform capnography
- Do not hyperventilate

Treat Hypotension
SBP<90mmHg
- IV bolus (1-2L NS or LR)
- Vasopressor infusion
- Epinephrine
- Dopamine
- Consider treatable causes
- 12-Lead ECG - Look for STEMI if so, cath lab

Does the patient follow commands?
- Yes - hypothermia contraindicated
- No - consider induced hypothermia

Points to Ponder

- COMPRESSIONS are very important.
- Rigor mortis is an indicator of termination of efforts.
- Simple airway maneuvers, such as a head-tilt, may help.
- The Medical Emergency Teams (MET) can identify and treat pre-arrest situations.
- Consider terminating efforts after deterioration to asystole and prolonged resuscitation time.
